

Week 2

AI Fluency Assignment 1 – Frame It as Cases: Work That Speaks for Itself

Name: Sibgha Mursaleen

Date: 13 July 2026

1. Voice Card

Professional, clear, honest, simple, confident, concise. Short sentences. No buzzwords.

2. Bio

I build landing pages for early-stage SaaS and AI founders launching their first website. My goal is to help new products make a credible first impression from the very first click.

3. Case Studies

Case Study 1

Orchard Bliss — Launching a Premium Brand from Nothing

Orchard Bliss is a self-directed project, not a client engagement. I built it to explore how a premium brand could establish a credible online presence from day one, starting with no existing website.

The goal

Orchard Bliss is a premium juice brand with no existing website. My goal wasn't to sell juice online—it was to encourage customers to visit the physical shop. That single objective shaped every design decision I made.

The first version was wrong, and I caught it early

I initially started building the website like an e-commerce store, with product-focused sections and an online shopping mindset. Before expanding it into a complete shopping experience, I realized it didn't match the actual goal. Visitors didn't need a cart or checkout—they needed a reason to visit the shop. I redesigned the homepage as a landing page that introduced the brand, highlighted featured drinks, and guided visitors toward exploring the menu and visiting the store.

The decisions that followed served that one goal

I kept the layout minimal instead of filling it with unnecessary sections, allowing the products and brand identity to stand out. I chose a fresh green-and-white color palette to reinforce the brand's natural and premium identity. I also built the website to be fully responsive because many visitors would likely discover the brand on their phones before deciding to visit the shop.

The result

The final outcome was a complete, responsive landing page that presents Orchard Bliss as a premium brand rather than a generic online store. Most importantly, every section supports the website's primary goal of encouraging visitors to come to the physical shop instead of purchasing online.

What I'd do differently

If I were building Orchard Bliss again or for a real client, I would spend more time understanding the brand, defining the business goal, deciding the primary action I wanted users to take, and creating a sitemap before designing any pages. That planning would help ensure every design decision supports the website's purpose from the beginning.

Why this matters if you're a founder launching a SaaS or AI product

Although Orchard Bliss isn't a SaaS or AI product, the challenge is similar: starting with no existing website and creating a professional first impression that supports a clear business goal. This project demonstrates how I make design decisions based on purpose, not just appearance.

Case Study 2

Lumina3D — A Landing Page Inspired by Modern Tech Startups

Lumina3D is a self-directed project, not a client engagement. I built it to explore how a modern landing page could combine 3D visuals, motion, and clean frontend design to create a strong first impression.

The goal

Lumina3D wasn't built for a real product. My goal was to create a landing page inspired by the visual style of modern SaaS and technology startups. I wanted to design a page that felt professional, interactive, and visually engaging while maintaining a clear focus on the user's attention and the primary call-to-action.

The key decision: no fake product

Since Lumina3D wasn't based on a real application, I chose not to create a fake product interface. Instead, I used abstract 3D elements to communicate innovation and creativity without pretending there was a working application behind the design. I paired those visuals

with a dark, minimal layout, limited navigation, and a single primary call-to-action so visitors could focus on the headline and the overall experience rather than unnecessary content.

The first version tried too hard, and I caught it

My initial design included too many animations and 3D effects because I wanted the page to feel impressive. As I continued building, I realized the extra motion distracted from the main message. I reduced the number of animations, slowed the movement, and simplified the overall experience so the visuals supported the content instead of competing with it.

The result

The final outcome was a complete, responsive landing page that captures the visual language of modern technology websites while remaining clean and focused. More importantly, the project strengthened my understanding of how 3D elements and animations should enhance the user experience rather than exist only for visual appeal. I've carried that lesson into every frontend project I've built since.

What I'd do differently

If I were building Lumina3D for a real SaaS or AI founder, I would begin by understanding the product, its target audience, and the business goals before designing the interface. Since this project was created to demonstrate my frontend and 3D design skills, there was no real product story to communicate. On a real client project, I would connect every visual decision to the product's message, test the experience across different devices for performance, and validate design decisions with the client throughout the process.

Case Study 3

Memory Card — Designing an Interaction, Not Just an Interface

Memory Card is a self-directed project, not a client engagement. I built it to explore how thoughtful interaction design can make a simple idea feel more meaningful and engaging.

The goal

The idea came from a memory-card concept I saw in an advertisement. I wanted to create a simple web application where users could capture memories by writing on the back of digital cards. My goal wasn't to build a social platform or a productivity tool, but to create a focused experience that made saving and revisiting memories feel personal.

The key decision: make it feel like a card, not a form

Instead of presenting users with a standard text field, I designed the experience around a card interaction. Users first select a card and then write on its back, making the interaction feel more deliberate and memorable than simply filling out a form. I kept the interface minimal, displaying memories as individual cards that are easy to browse without unnecessary features competing for attention.

The first version prioritized the wrong thing, and I caught it

At first, I focused too much on the flip animation itself. As I refined the project, I realized users might not immediately understand that they needed to select a card before writing. I simplified the interaction, removed unnecessary steps, and made the flow clearer so the interface explained itself instead of relying on users to figure it out.

The result

The final outcome was a clean, interactive frontend experience that transformed a simple note-taking idea into something more personal and engaging. More importantly, the project reinforced an important lesson: interactions should always be intuitive first and delightful second. That principle has influenced how I approach every frontend project since.

What I'd do differently

If I were building Memory Card again, I would test the interaction with real users much earlier to identify confusing moments before finalizing the interface. For a real client, I would begin by understanding the product goals, target audience, and the primary action users should take before designing the interaction. While the Memory Card concept itself isn't something I'd directly reuse for a SaaS or AI product, the approach of creating interactions that are simple, clear, and purposeful is something I would apply to any frontend project.

4. Contact / CTA

Send me a short description of what you're building, and I'll tell you what a launch-ready site could look like.

5. Before / After

Before (Generic AI)

I created a modern landing page with responsive design and animations.

After (Edited)

I built Lumina3D as a self-directed landing page inspired by modern SaaS websites. I reduced unnecessary animations so the visuals supported the message instead of distracting from it.
